 Review basics of Solar Water Heating (SWH) systems

- Illustrate technical characteristics that are used to describe solar collectors
- Examples of solar thermal systems

# Solar Water Heating in Various Climates

#### **RETS**CREEN<sup>®</sup> INTERNATIONAL

 For a domestic solar water heating system with <u>65 ft<sup>2</sup> of glazed</u> <u>collector</u>, a demand of <u>80 gal/day</u> of hot water at <u>140 °F</u> and <u>80 gal of</u> <u>storage</u>, the solar fraction is:

21% in Tromsø, Norway (70°N)
40% in Yellowknife, Canada (62°N)
32% in Warsaw, Poland (52°N)
51% in Harbin, China (46°N)
67% in Sacramento, USA (39°N)
39% in Tokyo, Japan (36°N)
78% in Marrakech, Morocco (32°N)
75% in Be'er-Sheva, Israel (31°N)

81% in Matam, Senegal (16°N)
59% in Puerto Limón, Costa Rica (10°N)
59% in Jakarta, Indonesia (6°S)
86% in Huancayo, Peru (12°S)
69% in Harare, Zimbabwe (18°S)
65% in Sydney, Australia (34°S)
39% in Punta Arenas, Chile (53°S)

# What do SWH systems provide?

#### **RETS**CREEN<sup>®</sup> INTERNATIONAL

#### **Domestic Hot Water** $\bigcirc$

- **Process Heat**  $\bigcirc$
- Swimming Pool Heating

### ...but also...

- Increased hot water storage
- Extended swimming season (pool heating)

# Components of SWH Systems

#### **RETS**CREEN<sup>®</sup> INTERNATIONAL

Closed Loop, Freeze-Protection System

### Main Components:

www.retscreen.net

- solar collector
- solar storage tank
- heat exchanger
- auxiliary heat source
- controller
- pump
- copper piping + insulation
- valves, fittings, gauges...

Photo Credit: Southface

# **Unglazed Solar Collectors**

#### **RETS**CREEN<sup>®</sup> INTERNATIONAL

- Low cost
- Low temperature
- Rugged
- Lightweight
- Seasonal pool heating
- Low pressure

Poor performance in cold or windy weather

Photo Credit: EERE

# **Glazed Flat Plate Solar Collectors**

#### **RETS**CREEN<sup>®</sup> INTERNATIONAL

- Moderate cost
- Higher temperature operation
- Can operate at mains water pressure
- Heavier and more fragile

# **Evacuated Tube Collectors**

#### **RETS**CREEN<sup>®</sup> INTERNATIONAL

- Higher cost
- Little convection losses
- High temperature
- Cold climates
- Fragile
- Installation can be more complicated
- Snow is less of a problem

### **Solar Collector Parameters**

#### **RETS**CREEN<sup>®</sup> INTERNATIONAL

www.retscreen.net

Collector's Efficiency Equation (how efficient is the collector in capturing the sun's energy):

Collector efficiency = heat capturing capability - heat loss

 $\eta$ , Greek for eta

Fr( $\tau \alpha$ ), Fr(tau alpha)

Given by Industry

The amount of solar energy that can be absorbed by the collector is characterized by Fr (tau alpha), its optical efficiency. The higher, the better.

© Minister of Natural Resources Canada 2001 – 2004.

Solar radiation

Solar collector

### Solar Collector Heat Loss

#### **RETS**CREEN<sup>®</sup> INTERNATIONAL

www.retscreen.net

heat loss of a collector: Fr UL \*  $(T_m - T_a)/G$ Delta T: Collector fluid T minus air T Solar insolation (W/m<sup>2</sup>) Fr UL in (W/m<sup>2</sup>/<sup>o</sup>C) Given by Industry G: solar insolation Energy that is lost back to the environment, e.g. due to bad collector insulation. Characterized by Fr UL, the collector's thermal losses. temperature of The smaller, the better. the collector fluid T<sub>a</sub>: temperature of air around the collector

### **Solar Collector Parameters**

#### **RETS**CREEN<sup>®</sup> INTERNATIONAL

Linear Efficiency Equation (how efficient is the collector in capturing the sun's energy):

### $\eta = Fr(\tau \alpha) - Fr UL * (T_m - T_a)/G$

Collector efficiency = heat capturing capability - heat loss

Fr (tau alpha), the collector's optical efficiency. The higher, the better.

G: solar radiation

temperature of the collector fluid

Fr UL, the collector's thermal losses.

T<sub>a</sub>: temperature of air around the collector

# Solar Collector Efficiency Graph

#### **RETS**CREEN<sup>®</sup> INTERNATIONAL

E.g. A glazed collector has following parameters determined by SRCC test: Fr (tau alpha) = 0.737 (y-intercept of graph) Fr UL =  $4.57 \text{ W/m}^2/^{\circ}\text{C}$  (slope of graph) Put into efficiency equation:

 $\eta = 0.737 - 4.57*(T_m - T_a)/G$ 

# Solar Collector Performance

# Solar Water Heating Project Considerations

#### **RETS**CREEN<sup>®</sup> INTERNATIONAL

- Factors for successful projects:
  - Large demand for hot water to reduce importance of fixed costs
  - High energy costs (e.g. natural gas not available)
  - No reliable conventional energy supply
  - Strong environmental interest by building owner/operator
- Daytime hot water loads require less storage
- Lower cost, seasonal systems can be financially preferable to higher-cost year-round systems
- Maintenance similar to any plumbing system, but operator must be committed to timely maintenance and repairs

### MA and Federal Incentives

#### **RETS**CREEN<sup>®</sup> INTERNATIONAL

Residential Installations:
National Grid rebate: 15%, capped at \$1,500
MA Tax Credit: 15%, capped at \$1,000
Federal Tax Credit of 30%, capped at \$2,000

### **Commercial Installations:**

-National Grid rebate: \$3-\$8 per 1st year therm output

-MA income tax deduction (i.e. a 9.5% tax credit)

-Federal Tax Credit of 30% (uncapped)

- 5-year accelerated depreciation (MACRS)

### Interactions

-Must subtract rebate amount before tax credits calculated

-Must further reduce by half of tax credit amount before depreciation is calculated

# Examples: Australia, Botswana and Sweden Domestic Hot Water Systems

#### **RETS**CREEN<sup>®</sup> INTERNATIONAL

- Systems produce heat on cloudy days
- Systems provide 20 to 80% of hot water
